Fishing Fleets

<u>Fishing Fleet Name</u>	<u>Years</u>	<u>Discard Mortality</u>	<u>Catch Error Type</u>	<u>Selectivity</u>	<u>Retention Periods</u>	<u>Composition Error Type</u>
North_Commercial_GNBS	1981-2022	1	Lognormal	Double Normal Length and Derived Age	1981-1991, 1992-1997, 1998-2022	Multinomial
North_Commercial_Other	1981-2022	n/a	Lognormal	Double Normal Length and Derived Age	1981-2022*	Multinomial
North_Recreational	1981-2022	0.08	Lognormal	Double Normal Length and Derived Age	1981-1991, 1992-1997, 1998-2022	Multinomial

*The commercial other fleet is a selectivity block, not a retention block, due to a lack of discard information.

Fishery Independent Surveys

<u>Survey Name</u>	<u>Years</u>	<u>Timing</u>	<u>Catch Error Type</u>	<u>Selectivity</u>	<u>Composition Error Type</u>
NC_BagSeine	1991-1995, 1997-2022	October 1	Lognormal	Age-0 Recruitment (SS special survey type 33)	NA
NC_GillNet	2003-2019, 2021-2022	October 1	Lognormal	Double Normal Length and Derived Age	Multinomial
NC_Longline	2007-2019, 2021-2022	September 1	Lognormal	Logistic Age	Multinomial

Data

Two Models Considered

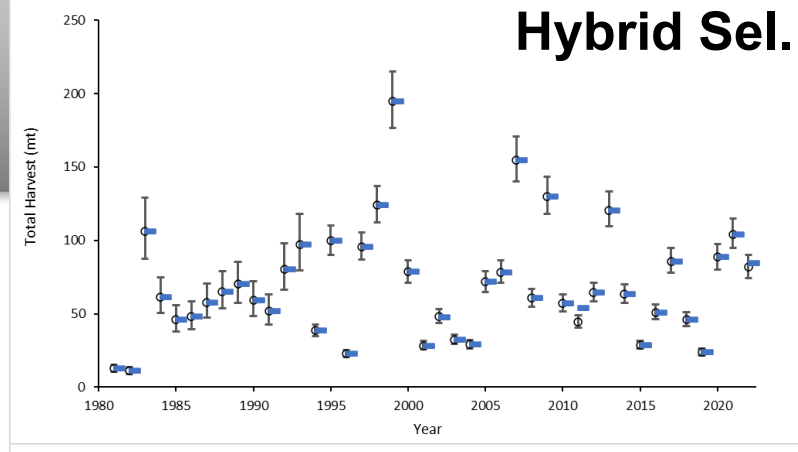

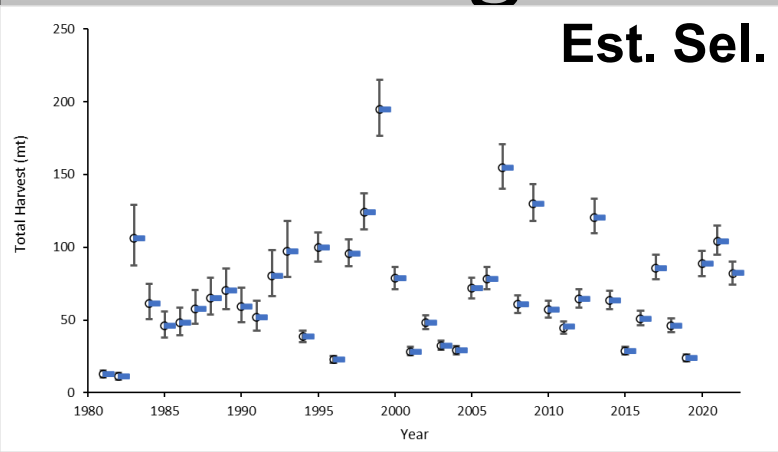

- Estimated Selectivity Model
 - Selectivity parameters estimated for all 3 fleets
 - Narrow rec fleet selectivity & low selectivity for larger fish
 - Model convergence often not achieved
- Hybrid Selectivity Model
 - Fixed selectivity for Comm_GNBS and Rec fleets
 - Based on simulation assessment
 - Estimated selectivity for Comm_Other
 - Initial fits to comp data suggested misspecification in simulation assessment
 - Retention parameters were still estimated in the model

Model Parameters & Convergence/Stability

	Estimated Selectivity Model	Hybrid Selectivity Model
Maximum Gradient	0.00425	0.01789
Hessian Matrix Positive Definite	Yes	Yes
Estimated Parameters	62	54
Estimated Deviations	54	54
Parameters within 1% of Bounds	13	0
Parameters Highly Correlated (>+0.95)	0	0
Parameters with Low Correlations (<0.01) with All Other Parameters	9	3

Historical Retrospective

Model Concerns

- Estimated Selectivity Model
 - Model not very stable and often not converging
 - High recruitment deviations in 1970s which drives abundance trends through time
 - Narrow recreational selectivity pattern with no selectivity for larger fish
 - Low initial F 's and high stock biomass through time
- Hybrid Selectivity Model
 - Recruitment deviations in 1970s more aligned with other large year classes (i.e. 2011)
 - Wider selectivity for the recreational fishery more aligned with expectations
 - Still low initial F s
 - F s overall are unreasonably high
- **No recommended model for stock status**
