Sustainable Fisheries Division Contribution No. SFD-2006- 031

Update 1: July 26, 2006

## INTRODUCTION

Data for red grouper from recreational fisheries surveys in the Gulf of Mexico are presented, including summaries of catch estimates and sampling fractions. Length distributions will be presented in a separate document entitled "Length Frequency Analysis of the Gulf of Mexico Recreational Red Grouper Fishery" by Steve Saul (SEDAR 12-DW-12). Issues addressed include the lack of estimates for fish released in the Headboat Survey and placement of the Keys landings into the Gulf of Mexico or Atlantic Ocean.

## OVERVIEW OF THE SURVEYS

Estimates of recreational catch for marine fish species in the Gulf of Mexico beginning in 1981 are obtained by a combination of results from three surveys:

- the Marine Recreational Fishery Statistics Survey (MRFSS) conducted by the NOAA Fisheries (NMFS).
- the Texas Marine Sport-Harvest Monitoring Program by the Texas Parks and Wildlife Department (TPWD).
- the Headboat Survey (HBS) conducted by NMFS, Southeast Fisheries Science Center, Beaufort, NC.

These three surveys together provide estimates of catch in numbers (and sometimes weight), estimates of effort, length and weight samples, and catch-effort observations for shore-based and boat fishing. The combined coverage is continuous beginning in 1981 with only minor gaps (see table below).

Recreational Surveys available for Gulf and Atlantic: MRFSS, Headboat, and TPWD

| Survey | Area | Timeframe | Mode* |
| :--- | :--- | :--- | :--- |
| MRFSS | 1. TX (not all modes/waves) | $1.1981-1985$ | 1. SH, HB/CH, PR |
|  | 2. ME-VA | 2. 1981-present (except 1981, wave 1) | 2. SH, HB/CH, PR |
|  | 3. NC-LA | 3.1981 -present (except 1981, wave 1) | 3. SH, CH, PR |
|  | 4. USVI | 4.2000 | 4. SH, CH, PR |
|  | 5. PR | 5.2000-present | 5. SH, CH, PR |
| Headboat | 1. NC-FLE (incl. Keys) | $1.1972-$ present | $1 . \mathrm{HB}$ |
|  | 2. FLW-TX | 2.1986-present | 2. HB |
| TPWD | TX | 1983-present | CH, PR |
| *mode abbreviations (SH=shore, HB=headboat, CH=charterboat, PR=private/rental) |  |  |  |

The MRFSS and the TPWD survey are both sampling-based, while the Headboat Survey strives to be a census of headboats
using logbooks. The strata, data gathered and quantities estimated also differ. Strata for estimates of catch from the three surveys can be made comparable by summing (e.g., summing Headboat Survey estimates into bi-monthly "waves" to match MRFSS and TPWD). Other differences, such as the lack of estimate of released fish in the Headboat Survey and different measures of effort, must also be addressed.

## MRFSS

The MRFSS provides information on participation, effort, and species-specific catch. Data are collected to provide catch and effort estimates in two-month periods ("waves") for each recreational fishing mode (shore fishing, private/rental boat, charterboat, or headboat/charterboat combined) and area of fishing (inshore, state Territorial Seas, U.S. Exclusive Economic Zone) in each state, except TX. MRFSS was conducted in TX through only 1985 and did not include all modes in all years. Starting in 1986, MRFSS has not covered Headboats in the Gulf of Mexico and South Atlantic. Before 1986, charterboats and headboats were combined as one mode. No survey was conducted in wave 1 of 1981. Survey data for TX in 1981-1985, Wave 4, are no longer available. (Note: the MRFSS is in the process of re-incorporating headboats in some states, but headboat estimates are not yet being provided.) Catch estimates are made for strata used in the intercepts: fish landed whole and observed by the samplers ("Type A"), fish reported as killed by the fishers ("Type B1") and fish reported as released alive by the fishers ("Type B2").

Two surveys within MRFSS provide the information described above: the "traditional" MRFSS and the For-Hire Survey (FHS), or "new charterboat method," discussed below. The traditional MRFSS design is based on an intercept survey of anglers and telephone survey of coastal households and has been used since the inception of the MRFSS. It applies to all fishing modes included in the survey. For 1981-1985 in TX to ME and for all years in VA to ME, the traditional MRFSS covered charterboats and headboats as a combined mode.

In 1998, the FHS began providing estimates for charterboats in some states. The traditional MRFSS and FHS operate concurrently, but the FHS estimates have been phased in as the "official" charterboat estimates starting with LA through FL West Coast in 2000. (This was expanded to the FL East Coast in 2003 and to GA through ME starting in wave 2 of 2005.) This new method was needed because of the low number of charterboat anglers contacted in the traditional telephone survey of coastal households.

## For Hire Survey and calibration of old method estimates with the new method.

In the FHS, directories of charterboats are developed for each state and are continuously updated. Each week, a sample of $10 \%$ of the listed charterboats are surveyed by telephone to ask about their fishing effort during the previous week, including the number of vessel trips, the number of anglers, areas fished and other information. Validation surveys by field samplers directly observe some charterboat effort on the docks to allow correction of over and under-reporting of trips in the telephone survey.

The MRFSS intercept survey of anglers at boat access sites is conducted as usual, encountering some charterboats. This allows calculation of a correction factor for charterboat trips on unlisted boats (not in the charterboat directory): (total intercepted cbt angler trips) / (intercepted cbt angler trips on listed boats).

Thus the estimate of total charterboat angler trips for an area of fishing is:
Estimated total charterboat angler trips =
(total charterboat angler trips in on listed boats) * (correction factor for trips on unlisted boats) where the total charterboat angler trips on listed boats is based on the $10 \%$ sample in the telephone survey and corrected for over/under reporting by the validation survey.

The FHS estimates of catch then follow in the same manner as for the traditional MRFSS, with the mean catch per trip coming from the MRFSS intercept survey. The pilot study of new charterboat methods in the Gulf of Mexico found that the annual effort at the state and Gulf level were not significantly different between the pilot study and the traditional MRFSS. However, the effort from the new charterboat methods differed from the traditional MRFSS in the distributions of effort by area and season.

Conversion factors were estimated by Diaz and Phares to calibrate the traditional MRFSS charterboat estimates for 19811997 with the FHS in the Gulf of Mexico (Diaz and Phares, 2004). In addition to the official FHS estimates for 2000-2003,
estimates were also made for 1998-1999 using the FHS methodology. Thus the relationship between the old charterboat method estimates of trips and the FHS for 1998-2003 was used to estimate the conversion factors. The following are the conversion factors and standard errors (in parentheses):

Apply to 1986 - 1997 charterboat mode in AL, LA, and MS

|  | WAVE |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 5 | 6 |
|  | $1.26(1.31)$ | $1.54(1.27)$ | $3.82(1.26)$ | $4.67(1.26)$ | $3.28(1.27)$ | $1.48(1.28)$ |
|  | $0.74(1.37)$ | $0.75(1.26)$ | $1.49(1.25)$ | $2.28(1.24)$ | $0.64(1.28)$ | $0.52(1.40)$ |
|  | $0.44(1.28)$ | $0.63(1.24)$ | $2.23(1.23)$ | $1.87(1.24)$ | $1.26(1.23)$ | $0.53(1.28)$ |

Apply to 1986-1997 charterboat mode in FLW

Sustainable Fisheries Division Contribution No. SFD-2004-036.

## Headboat Survey (HBS)

The Headboat Survey covers the Gulf of Mexico headboats starting in 1986. (At the same time, the MRFSS combined charter+headboat mode estimates changed to charterboat only for the Gulf and South Atlantic states.)

Total catch per trip is reported in logbooks provided to all headboats in TX through NC. Agents collect these logbook trip reports and sample some trips to gather size data. Although reporting via the logbooks is mandatory, compliance is low in some areas for recent years, especially South Florida. The HBS creates substitutes for the missing reports based on data for similar vessels or time periods, thus providing estimates of total catch by month (or groups of months) and area. Each vessel is assigned to one of 26 Gulf of Mexico and South Atlantic areas, based on the port from which the vessel operates and the general fishing area. (There are areas that are not used anymore, including a few very general geographic areas and one for the Bahamas).

The survey was inconsistent in LA in 2002-2005. There were no trip reports collected in LA in 2002. 2001 trip reports were used (by the HBS) as a substitute to generate estimates numbers caught (though there are some minor differences between the resulting estimates for the two years). In 2003, there were only a few trip reports but they were still used to
generate the estimates. In 2004 and 2005 there were no trip reports or fish sampled, and no substitutes were used, so there are no estimates or samples for 2004 and 2005.

## TX Parks and Wildlife Survey (TPWD)

There were no red grouper estimates in the TPWD survey from 1983-2005.

## CATCH ESTIMATES and SAMPLING PROPORTIONS

## MRFSS

Tables $1-7$ show the MRFSS catch estimates and CVs by mode and by state, sampling proportions by mode. Sampling proportions use the number observed (tspclaim = type A catch sampled) and number measured for length (tsp_lex) contained on the catch estimates records. There may be minor differences between these and the same quantities calculated directly from the intercept files. Sampled catch (observed or measured) may occur in cells where there is no catch estimate. This occasionally happens when the intercept survey encounters fishers in a state-wave-mode cell but there is no corresponding estimate of trips, usually in the traditional MRFSS in a charterboat cell with low effort. Sampled fish with no corresponding estimate were kept in calculating the proportions but this does not greatly affect the proportions.

In the tables, estimated $\mathrm{A}+\mathrm{B} 1$ is the catch that was killed and B 2 is the catch that was released alive. In the intercepts, Type A is the catch that was seen and identified by the interviewer, thus is the "observed catch" in the sampling proportions. Type A estimates are the expansion of the observed catch.

Tabulated estimates use the new charterboat method (FHS) for 1998-2004. Except as noted, the charterboat estimates for 1986-1997 and charter+headboat estimates for 1981-1985 are calibrated to the new method using the conversion factors estimated in Diaz and Phares. CVs for the calibrated charterboat and charter+headboat in 1981-1997 do not include the variance associated with the calibration factor.
*Final 2005 estimates were provided at the Data Workshop by Tom Sminkey.
Table 1. Estimated MRFSS A+B1 catch (fish killed) and coefficients of variations (CV) by mode for red grouper in the Gulf of Mexico. Charterboat and cbt/hbt estimates use the new method or are calibrated to the new method.

Table 2. Estimated MRFSS B2 catch (released alive) and coefficients of variations (CV) by mode for red grouper in the Gulf of Mexico. Charter and cbt/hbt estimates use the new method or are calibrated to the new method.

Table 3. Estimated MRFSS A+B1 (fish killed) and B2 catch (released alive) by state for red grouper in the Gulf of Mexico. Charter and cbt/hbt estimates use the new method or are calibrated to the new method.

Table 4. Comparison of MRFSS old charterboat method estimates to recalibrated charterboat estimates (using conversion factors from Diaz and Phares) for red grouper in the Gulf of Mexico.

Table 5. Percent of MRFSS Type A catch estimate that was measured by mode for red grouper in the Gulf of Mexico. Charter and cbt/hbt estimates use the new method or are calibrated to the new method.

Table 6. Percent of MRFSS observed Type A catch that was measured by mode for red grouper in the Gulf of Mexico. Charter and cbt/hbt estimates use the new method or are calibrated to the new method.

Table 7. Percent of MRFSS Type A catch estimate that was observed by mode for red grouper in the Gulf of Mexico. Charter and cbt/hbt estimates use the new method or are calibrated to the new method.

The MRFSS includes the Keys in FLW. However, separating the Keys into a separate "state" can be considered. The MRFSS post-stratified estimates which treat the Keys separately are shown in Table 8. *Final 2005 estimates were

## provided at the Data Workshop by Tom Sminkey.

Table 8. Estimated MRFSS A+B1 catch (fish killed) and coefficients of variations (CV) by Florida region for red grouper in the Gulf of Mexico. Charterboat and cbt/hbt estimates use the new method or are calibrated to the new method.

## Headboat Survey

Tables 8-10 show the Headboat Survey catch estimates and sampling proportions by year and area group. Sampling proportions use the estimated number of fish and number of fish measured by the samplers. Occasional trip reports may have observed catch that does not correspond to an estimate (by area and month) or observed catch with weight but no number reported. Occasional length samples may not match any estimate or trip report. These are retained in calculations of total catch and sampling proportions but they do not greatly affect the results.

Table 9. Headboat Survey estimated catch by area groups for Gulf of Mexico red grouper. (Estimated catch includes only kept fish.)

Table 10. Percent of Headboat Survey estimated catch that was measured by area groups for Gulf of Mexico red grouper.
Table 11. Percent of Headboat Survey estimated catch that was reported in logbooks by area groups for Gulf of Mexico red grouper.

Headboat Survey Gulf and Keys area codes for reference in reviewing the tables:
$12=$ Fl. Keys, Atlantic-based vessels
17=Dry Tortugas (Atlantic/Keys-based vessels)
18=Dry Tortugas (Gulf vessels)
$20=$ SW FL ( $1 / 2$ and 3/4-day trips) - [may be out of use?]. (Naples to Crystal River)
$21=$ SW FL - full day trips (Naples to Crystal River)
$22=$ Fl. Middle Grounds trips
$23=$ NW FL and AL (Carrabelle to Pensacola, including Panama City and Destin)
$24=$ LA
25=NE TX (Sabine Pass-Freeport)
26=Port Aransas, TX
27=Port Isabel, TX
In this report, Headboat Survey areas 12 and 17, which are considered "Atlantic" by the Headboat Survey, are included in the Gulf to make the Headboat areas included comparable to the MRFSS.

## ADJUSTMENTS TO ESTIMATES

## Estimation of the number of fish released in the Headboat Survey.

In 2004 the Headboat Survey logbook trip reports started collecting information on fish released alive and returned dead but estimates of the total fish released were not generated. However, the sample data (trip reports) for 2004 and 2005 can be used to suggest the use of the ratio of charterboat estimates for $\mathrm{B} 2 /(\mathrm{A}+\mathrm{B} 1)$ from the MRFSS to estimate the releases in the Headboat Survey.

Examination of the 2004 and 2005 headboat release data by vessel indicate that some vessels may not have been reporting released fish (or at least not on some trips). Since it was not clear which trips were reporting zero released fish and which were simply not reporting, only trips with some release data for any species were selected. Of those trips reporting releases, trips with red grouper (kept or released) were further selected. Of these, the quality of data may have varied. For instance, the reports for certain vessels often contained identical entries for the number of fish released as the number of
fish kept, a prominent difference from other vessels.
Tables 12 and 13 show the ratios for fish released alive to fish killed (kept + released dead) calculated using Headboat Survey 2004 and 2005 trip reports and MRFSS charterboat catch estimates for 2004 and 2005. For the Headboat Survey, the ratios are calculated as $\mathrm{r} \_\mathrm{hbt}=$ live/ (num+dead), where live $=$ fish released alive, num $=$ fish kept, and dead $=$ fish released dead. For the MRFSS, ratios are $r_{-} m r f=B 2 /(A+B 1)$. In practice, the ratio $r_{-} m r f$ would be applied to the headboat catch estimate which corresponds to "num" only, since there is no estimate of fish released dead in the Headboat Survey. The MRFSS includes fish released dead in the B1 catch, and while the fish released dead can not be separated from other kinds of B1 catch in the estimates, this quantity is small in the sample data relative to the total B1 samples. Tables 14 shows data from headboat observer programs conducted by Florida and Alabama. Alabama data is available from 2004, wave 2 and Florida data is available in 2005. Table 15 shows ratios from MRFSS private catch estimates in 2004 and 2005.

Table 12. Ratios of fish released alive to fish killed (kept + released dead) from the Headboat Survey trip report data for red grouper in 2004 and 2005. Number of fish reported in logbooks as kept, released dead, released alive by area group and wave in the Gulf of Mexico. Only trips that reported discards for any species were used in this table.

Table 13. Ratios of fish released alive (B2) to fish killed (AB1) from MRFSS charterboat catch estimates in 2004 and 2005 by state and wave in the Gulf of Mexico.

Table 14. Ratio of fish released alive (B2) to fish killed (AB1) from headboat observer programs in Florida (2005+) and Alabama (2004+).

Table. 15 Ratio of fish released alive (B2) to fish killed (AB1) from MRFSS private mode estimates in 2004 and 2005 by state and wave in the Gulf of Mexico.

This adjustment using MRFSS estimates might also be calculated using the post-stratified MRFSS which estimate the Keys separately from FLW (Table 8).

General overview of the recreational surveys from the following:
Recreational Survey Data for Gag and Black Grouper in the Gulf of Mexico. Patty Phares, Vivian Matter, and Steve Turner. National Marine Fisheries Service, Southeast Fisheries Science Center, Sustainable Fisheries Division, January, 2006. Sustainable Fisheries Division Contribution No. SFD-2006-008.
