Introduction

During previous SEDAR data workshops considerable time and effort was devoted to developing methods of back-calculating recreational landings for years prior to the start of modern data collection programs and landings estimates. Methods used in past stock assessments included: ratios of commercial landings to recreational landings; estimates from the U.S. Fish and Wildlife Saltwater Angling Survey (SWAS); and U.S. Census data as a proxy for recreational fishing effort to produce regression estimates of catch. These approaches resulted in estimates that, in some cases, have generated a great deal of controversy.

In the Terms of Reference (TOR) for the SEDAR 28 Data Workshop (DW) for South Atlantic Spanish Mackerel, the Recreational Working Group (RWG) was tasked to “evaluate historic recreational catch information and modify, as necessary, pre-MRFSS estimates provided in SEDAR 17.” In order to address this task, the RWG reviewed the SWAS used in SEDAR 17 and evaluated other potential historical sources and methods to compile landings of Spanish mackerel prior to the available time series of MRFSS and headboat estimated landings (1981).

Historical Angling Sources

Salt Water Angler Surveys (SWAS)

The historic recreational landings of Spanish mackerel are defined as pre-1981 for the charter boat, headboat, private boat, and shore fishing modes; pre-1981 represents the start of the Marine Recreational Fisheries Statistics Survey (MRFSS) and the beginning of landings estimates for Spanish mackerel in the South Atlantic from the Southeast Region Headboat Survey (SRHS). SEDAR 17 included historical recreational landings estimates for 1950 – 1980, based on linear interpolation using the SWAS landings estimates from 1960, 1965, and 1970. The work group noted that the SWAS landings estimates for Spanish mackerel were six times those of recent years. These high estimates were attributed to recall bias and possible exaggeration of catches by anglers (SWAS 1960). The small sample size of SWAS angler interviews may have further inflated these estimates. The mean interview sample size for the three SWAS was 0.02% of total estimated saltwater anglers in the US. The changes in the SWAS methodology over the years were also discussed by the RWG as part of the overall discussion regarding the potential uncertainty and bias for this method.

Anderson, 1965

The RWG discussed the study by Anderson (1965 [SEDAR28-RD04]) as a possible source of information for historical landings of Spanish mackerel. Anderson’s study area focused on Cape Canaveral, FL, including Brevard and Volusia counties. Field surveys were conducted from

February to October 1963. The RWG considered the Anderson study spatially and temporally limited, thus not useful for expanding coastwide estimated landings prior to 1981.

National Survey of Fishing, Hunting, and Wildlife-Associated Recreation Survey (FHWAR), U.S Fish and Wildlife Service (USFWS).

The National Survey of Fishing, Hunting, and Wildlife-Associated Recreation Survey has been conducted every 5 years since 1955 and is one of the oldest and most comprehensive recreational surveys. Among other things, its purpose is to gather information on the number of anglers in the United States, including frequency and time spent fishing (FHWAR 1991).

The FHWAR Surveys published in 1991, 1996, 2001 and 2006 provide summary tables (Comparison of Major Findings of the National Surveys: 1955 to 1985) of U.S. population estimates, along with estimates of fishing participation and effort from surveys conducted by the USFWS every five years from 1955 to 1985 (Tables 1 and 2). This information was used to develop an alternative method for estimating coastwide recreational landings prior to 1981.

FHWAR Method

The two key components from the FHWAR surveys used in this census method were the estimates of U.S. saltwater anglers and the estimates of U.S. saltwater days. The first objective was to determine the total saltwater anglers and saltwater days from New England to the South Atlantic (NE-SA) by using the summary information of U.S. anglers and U.S. saltwater anglers from the FHWAR surveys. The ratio of U.S saltwater anglers to the total U.S anglers was applied to the total number of anglers for the NE-SA to yield the total saltwater anglers for NE-SA. The same method was used to calculate the total saltwater days for the NE-SA from the FHWAR surveys from 1955-1985.

The FHWAR surveys for the South Atlantic included the entire state of Florida - east and west coasts. In order to address the management boundaries for Spanish mackerel, the saltwater angler days for Florida's west coast (FLW) were separated from the NE-SA saltwater angler days using the ratio of the MRFSS total angler trips for FLW to the MRFSS total angler trips for Maine to FLW. The mean ratio from 1984-1986 was applied to the total saltwater days for the NE-SA from 1955-1985 to remove FLW effort.

Similar to the SWAS, there was a 12-month recall period for respondents participating in the FHWAR surveys from 1955 – 1985. As part of the 1991 FWHAR, a study was conducted to compare the 12- month recall period to a four-month period. This study revealed that the level of recall bias varies for different types of fishing participation and expenditure (FHWAR, 1991). Consequently, it was necessary to account for possible reporting bias and adjust the angling effort

(saltwater days) in the FHWAR Surveys 1955-1985. In the case of Spanish mackerel in the South Atlantic, the total saltwater days for the NE-SA 1955-1985 were adjusted for recall bias in the FHWAR surveys by using the mean MRFSS total angler trips for the US East Coast (ME-FLE) 1984 to 1986, divided by the total saltwater days from the 1985 FHWAR Survey. This multiplier was then applied to the total NE-SA saltwater days from 1955-1985 to adjust for recall bias.

Using the adjusted saltwater days for NE-SA from 1955 – 1985, the next step in this process was estimating landings of Spanish mackerel. This was accomplished by calculating the mean CPUE for Spanish mackerel in the South Atlantic from the MRFSS landings estimates for 1981 to 1985. This mean CPUE was then applied to the adjusted saltwater days for the NE-SA from 1955-1985 to estimate the historical landings of Spanish mackerel for those years (Table 3). Linear interpolation was used to estimate landings for years that the FHWAR surveys were not conducted during 1955-1980. Since historical recreational landings for Spanish mackerel were only lacking prior to 1981, the 1985 estimated landings using the FHWAR census method were excluded (Table 4).

A bootstrap analysis was used to capture the range of uncertainty in the historic recreational catch estimates. More specifically, the historic catch estimates were based on the mean CPUE and the ratio of MRFSS effort to historic estimates of effort. These two quantities were bootstrapped 200 times using the empirical estimates that went into each. The 5th and 95th percentiles were then computed from the distribution of bootstrap estimates to characterize the uncertainty (Figure 2).

Conclusions

The FHWAR method utilizes a combination of information including U.S. angler population estimates and angling effort estimates from 1955 – 1985 FHWAR, along with estimates of recreational effort and landings from the MRFSS 1981 – 1985. The FWHAR method also used both sources of information to adjust for recall bias, an issue that must be addressed when considering using either the SWAS or the FHWAR Surveys for historical recreational landings. By using data from FHWAR and the MRFSS to calibrate this adjustment, the effect of the 12-month angler recall period is reduced. The historical landings of Spanish mackerel that were calculated using this method show a gradual increase from 1955 to 1980, as opposed to the significant landings represented in SEDAR 17 using the SWAS estimates for the same time period (Figure 3). The FHWAR method could be used for other species by adjusting the geographic range of the FHWAR surveys to match management boundaries and the associated MRFSS catch and effort data for a particular species.
