Continuity Runs for Atlantic Sharpnose and Bonnethead SEAMAP Groundfish Surveys and NMFS Bottom Longline Surveys

Adam G. Pollack and G. Walter Ingram, Jr.
NOAA Fisheries, Southeast Fisheries Science Center,
Mississippi Laboratories, Pascagoula, MS

Prior to the Data Workshop for SEDAR 34, we were asked to rerun abundance indices for use in continuity runs of the stock assessment models for Atlantic sharpnose, *Rhizoprionodon terraenovae*, and bonnethead, *Sphyrna tiburo*. Six indices were requested from the SEAMAP Groundfish survey and three were requested from the NMFS Bottom Longline survey. The indices requested were:

Species	Survey	Years	Table
Atlantic sharpnose	Summer SEAMAP Groundfish	1982-2011	1
Atlantic sharpnose	Fall SEAMAP Groundfish	1972-2011	2
Bonnethead	Summer SEAMAP Groundfish	1982-2011	3
Bonnethead	Fall SEAMAP Groundfish	1972-2011	4
Bonnethead	Early Fall SEAMAP Groundfish	1972-1986	5
Bonnethead	Late Fall SEAMAP Groundfish	1987-2011	6
Atlantic sharpnose	NMFS Bottom Longline – GOM	1995-2011	7
Atlantic sharpnose	NMFS Bottom Longline – Atlantic	1995-2011	8
Atlantic sharpnose	NMFS Bottom Longline – GOM & Atlantic	1995-2011	9

All abundance indices were constructed using the delta-lognormal method outlined by Lo *et al.* 1992. For the SEAMAP Groundfish indices, in the previous working documents a Bayesian approach was used, which was not able to be replicated and was thus replaced with the delta-lognormal approach. In addition, it is not known which version of the data was used; however, the most current set was used for these runs. The same concern and solution about the version of the data also applies to the NMFS Bottom Longline data. For a full review of the data, model variables and model selection refer to the current working document for SEAMAP Groundfish (SEDAR34-DW-##) and NMFS Bottom Longline (SEDAR34-DW-##).
