# Calculated discards of gray triggerfish from US South Atlantic commercial fishing vessels 

Kevin McCarthy<br>National Marine Fisheries Service, Southeast Fisheries Science Center Sustainable Fisheries Division, 75 Virginia Beach Drive, Miami, FL, 33149-1099<br>Kevin.J.McCarthy@noaa.gov<br>Sustainable Fisheries Division Contribution SFD-2014-011

## August, 2015

Discard calculations were updated to include 2014 data (Table 9). Calculated gray triggerfish kept for bait or eaten (including 2014 totals) are provided in Table 10. There were no reports of gray triggerfish kept for bait or eaten from the trap fishery.

## Introduction

In August 2001, the Southeast Fisheries Science Center (SEFSC) initiated a program to collect commercial fishing vessel discard data from South Atlantic fisheries. A reporting form was developed that supplements the existing vessel coastal logbook forms that are currently mandatory for those fisheries (Poffenberger and McCarthy, 2004). Discard data from the SEFSC coastal fisheries discard logbook program were used to calculate the number of gray triggerfish discarded from commercial vertical line (handline and electric/hydraulic reel, aka bandit rig) and trap (gray triggerfish only) vessels. Approximately 98.5 percent of gray triggerfish discards were reported from vessels fishing those gears.

Data collection for the discard logbook program involves, each year, a $20 \%$ random sample of vessels with South Atlantic snapper-grouper, king mackerel, Spanish mackerel, dolphin/wahoo, and shark permits selected to report the number of animals discarded by species. To assure that the sample was representative of vessels with those Federal permits fishing in the South Atlantic, the universe of permitted vessels was stratified by gear fished. Fishing gear strata included handline, bandit rig, trolling, longline, fish trap, gillnet, and diving. A random sample (weighted by effort reported for each vessel during the prior year) was selected from each stratum. The selected fishers were instructed to complete a supplemental discard form for each fishing trip. Trips with no discards were reported as such.

Reported data included the numbers of discards by species, estimated condition of the fish when released, reason for release (due to regulations or unmarketable/unwanted), and the fishing area where the animal was discarded. To calculate species specific discard rates, discard data were matched to the landings and effort data reported to the coastal logbook program. Condition of released fish could be reported as: all animals are dead, majority of the animals were dead, all animals were alive when released, majority of animals were alive, the fish were kept but not sold, and the condition of the animals is unknown.

## Methods

The objective of these analyses was to calculate the numbers of gray triggerfish discarded by vessels that fish commercially for species other than shrimp or other shellfish. Data were also restricted to exclude discard and effort information from pelagic longline vessels that typically fish for swordfish, pelagic sharks, and tunas. The data set included all commercial vertical line (handline and electric/hydraulic reel) and trap fishing trips from federally permitted vessels that reported discards between January 1, 2002 and December 31, 2013 in the US South Atlantic (statistical areas 2300-3700; Figure 1). Data from 2013 may
have been incomplete when the analyses were conducted. The available data for other gears were too few for discards to be calculated.

Total effort reported from the vertical line fishery was available for the years 1992-2013. Although South Atlantic effort data were available beginning in 1992, data collection during that initial year included only a 20 percent sample of commercial fishing vessels in Florida; all vessels in other states were required to report in 1992. All Florida vessels were required to report effort data beginning in 1993 and the SEDAR32 recommendation was to limit the time series to those years with complete effort reporting.

Gray triggerfish discards were initially calculated following the methods of SEDAR32 (McCarthy, 2013) and are summarized here as the continuity method. Due to the limited available discard data, discard rates were calculated as the nominal discard rate among all trips that reported to the discard logbook program over the period 2002-2013. Rates were calculated separately for vertical line and trap gears. Those discard rates were then multiplied by the yearly gear specific total fishing effort (vertical line: total hook-hours fished; trap: total number of traps fished) reported to the coastal logbook program to calculate total discards. Discards were calculated separately for those fish reported as discarded and those that were reported as "kept as bait or eaten".

Discards were also calculated separately for open and closed gray triggerfish seasons (season specific method). Season specific discard rates (mean 2012-13 rate) were multiplied by year and season specific total effort for each gear. The mean discard rate for the period 2002-11 was multiplied by yearly total effort to calculate discards for the years 1993-2011 for each gear. Total discards and total numbers of fish reported as "kept as bait or eaten" were calculated separately.

Commercial discards may be under reported. If selected, fishers are required to report to the discard logbook program in order to renew their federal fishing permits. Fishers remain in reporting compliance by returning discard logbooks with reports of "no discards". The percentage of discard reports returned with "no discards" from vertical line and trap trips has increased from 32 to 68 percent in the US South Atlantic over the period 2002-2013. During the SEDAR32 data workshop the issue of possible underreporting of commercial discards was discussed at length. The working group recommended that data be filtered to remove records from vessels that never reported discards of any species during a year. The SEDAR32 working group acknowledged that some South Atlantic commercial fishing trips may not have had discards of any species and discussed the likely maximum number of trips without a report of discards. The SEDAR32 commercial working group recommended excluding data from vertical line vessels that reported more than 17 trips without reporting discards of any species (the mean number of reported trips prior to the first trip with reported discard plus two standard deviations of that mean) or more than 3 trips (mean plus two standard deviations) without a report of discards in the trap fishery. Those data filters were included in the current analyses (continuity and season specific methods).

A further data filter, also recommended during SEDAR32, was to exclude from the total effort summary those trips that reported only mackerel landings. The assumption was that such trips were unlikely to have gray triggerfish discards. The opinion of the SEDAR32 data workshop working group was that including effort from those trips in discard calculations was inappropriate.

Discard logbook and coastal logbook data were also filtered to remove clearly erroneous data (values of gear-specific effort data beyond the 99.9 percentile of the data). Records with multiple gears fished on a trip were also excluded because discards could not be unambiguously attributed to a gear. That data filtering step was not necessary when summing total effort from the logbook data because reported effort data was gear-specific.

The completeness of 2013 effort data was estimated based upon trends in reporting to the coastal logbook program during the years 2010-2012. The percentage of delayed reporting by month during the years 2010-2012 was estimated by determining the number of reports received by June 23 (date of coastal logbook data set used in the analyses) during 2010-2012 compared to the total number of reports ultimately received for each of the years 2010-2012. The estimated level of reporting was 97.4 percent. The monthly mean estimates of reporting are provided below. No expansion of 2013 effort was used in the analyses.

| Month | Estimated percent reporting |
| ---: | :---: |
| Jan | 99.7 |
| Feb | 99.7 |
| Mar | 99.5 |
| Apr | 99.5 |
| May | 99.0 |
| Jun | 98.4 |
| Jul | 97.3 |
| Aug | 96.7 |
| Sep | 96.0 |
| Oct | 95.7 |
| Nov | 93.5 |
| Dec | 91.1 |

## Results and Discussion

The number of South Atlantic commercial fishing trips during 2002-2013 with reported discards of gray triggerfish (650 trips) was very low, severely limiting any analysis. Gray triggerfish were reported as discards primarily from vertical line and trap trips. Discards from all other gears combined were reported from 11 trips (Table 1a). Gray triggerfish accounted for $1.1 \%$ ( 9,293 fish) of all reported vertical line discards and $1.1 \%$ ( 2,833 fish) of discards reported from traps (Table 1b).

During the period 2002-2013, trips with reported gray triggerfish landings to the coastal logbook program included $10.8 \%(20,783)$ of all vertical line trips and $25.9 \%(1,866)$ of all trap trips (Table 2a). Gray triggerfish landings included $3.9 \%$ ( $3,307,357$ pounds) of all reported vertical line landings, $1.2 \%$ ( 64,133 pounds) of all trap landings, and $0.13 \%$ ( 112,436 pounds) of total landings by all other gears combined (Table 2b).

Calculated gray triggerfish discards, discard rates, discard rate coefficients of variation, and total effort (hook hours and traps fished reported to the coastal logbook program) are provided in Table 3 (continuity method) and Table 4 (season specific method). Calculated total gray triggerfish kept as bait are provided in Table 5 (continuity method) and Table 6 (season specific method). The numbers of gray triggerfish discards and kept fish were less than 10,000 fish per year. During the 2012 and 2013 closed seasons there were 444 and 1,084 , respectively, gray triggerfish reported as kept as bait or eaten. Those fish may have been kept under the recreational fishery daily bag limit. No gray triggerfish were reported as kept as bait in the trap fishery. Although landings of gray triggerfish by all gears other than vertical line were nearly twice the trap fishery landings of gray triggerfish, discards of gray triggerfish were rarely reported from those other gears.

More than $90 \%$ of gray triggerfish discarded in the vertical line fishery were reported as "alive" or "majority alive" (Table 7). A small percentage (8.9\%) of vertical line gray triggerfish was reported as 'kept for bait or eaten'. Gray triggerfish discards from the trap fishery were nearly all reported as alive or majority alive.

Gray triggerfish were discarded in the vertical line fishery most frequently due to regulations: $18.6 \%$ below legal size, 59.1 due to closed season, and $11.9 \%$ due to other regulations (Table 8). Prior to 2008 the reason for discarding could be reported as either due to regulations or due to market conditions. Beginning in 2008 the discard reporting form was expanded to include discarded due to the fish being under legal size or due to closed season. Reports from 2002-2007 citing discards as due to regulations were classified as 'other regulations' in Table 8 because discards due to closed season and due to legal size could not be determined. Market conditions were cited for an additional $8.8 \%$ of gray triggerfish vertical line discards. The high percentage of vertical line discards reported as due to closed season differs from that found during the SEDAR32 assessment ( $17.8 \%$ due to closed season). This is likely due to the lengthy gray triggerfish
closed season during 2013. The majority of gray triggerfish discards from the trap fishery was reported as due to market conditions.

The number of trips reporting gray triggerfish discards in the US South Atlantic was very low and the number of individuals reported as discarded was also low. Stratification of the available data was limited because of the small sample sizes and, therefore, the discard analyses described here likely do not capture much of the variation in numbers of discards within the gray triggerfish fisheries. Discard rates and calculated discards, unsurprisingly, differed greatly between open and closed fishing seasons; therefore, the calculated discards using the season specific method are recommended for use in the stock assessment. Variation in the number of discards among years with no closed season (or all years in the continuity method) was entirely driven by the effort reported from the vertical line and trap fisheries because a mean discard rate for the years 2002-2011 (or 2002-13, continuity method) was used in the calculation of discards for the years 1993-2011 (1993-2013, continuity method).

Table 2b. Landings (pounds whole weight) reported by gear fished; all years combined (2002-2013). Landings from trips that reported multiple gears fished may be counted more than once. "Other species" totals represent all other reported landings to the coastal logbook program.

| Species | Vertical line | Trap | All other gears |
| :--- | ---: | ---: | ---: |
| Gray triggerfish | $3,307,357$ | 64,133 | $112,436^{*}$ |
| All other species | $85,712,134$ | $5,437,342$ | $84,487,567^{* *}$ |

* $54.6 \%$ reported from longline vessels
** $23.4 \%$ reported from longline vessels

Table 3. Yearly discards of gray triggerfish from US South Atlantic commercial fisheries calculated using the continuity method. Data filters described in the text. Number of trips reporting to the discard logbook program was summed across the years 2002-2013. Vertical line effort $=$ hook hours fished, trap effort $=$ number of traps fished. Discards are reported as number of fish.

Table 4. Yearly discards of gray triggerfish from US South Atlantic commercial fisheries. Discards calculated separately for open and closed seasons. Data filters described in the text. Discard rate for the period 1993-2011 was the single rate calculated using combined 2002-2011 data. Open season 2012-13 discard rate was calculated using combined open season 2012-13 data. Closed season 2012-13 discard rate was calculated using combined closed season 2012-13 data. Numbers of trips (discards) were summed as defined above (i.e., 2002-2011, 2012-13 open season, 2012-13 closed season). Vertical line effort = hook hours fished, trap effort = number of traps fished. Discards are reported as number of fish.

Table 5. Yearly gray triggerfish discards reported as "kept as bait", by gear, from US South Atlantic commercial fishing vessels calculated using the continuity method. Kept rate used to calculate total kept fish was the single rate calculated when all data reported from 2002-2013 were combined. Number of trips reporting to the discard logbook program was summed across the years 2002-2013. Vertical line effort = hook hours fished, trap effort = number of traps fished. Calculated kept fish are reported as number of fish.

| Year | Gear | Trips (discards) | Trips (total effort) | Discard Rate | Discard Rate CV | Total Effort | Calculated Kept Fish |

## Addendum - updated calculated discards with 2014 data included

Table 9. Yearly discards of gray triggerfish from US South Atlantic commercial fisheries. Discards calculated separately for open and closed seasons. Data filters described in the text. Discard rate for the period 1993-2011 was the single rate calculated using combined 2002-2011 data. Open season 2012-14 discard rate was calculated using combined open season 2012-14 data. Closed season 2012-14 discard rate was calculated using combined closed season 2012-14 data. Trips (discards) $=$ trips reporting to the discard logbook program and were summed as defined above (i.e., 2002-2011, 2012-14 open season, 2012-14 closed season). Trips (total effort) = number of trips reporting to the coastal logbook program. Vertical line effort $=$ hook hours fished, trap effort $=$ number of traps fished. Discards are reported as number of fish.

Table 10. Yearly gray triggerfish discards reported as "kept for bait" from the US South Atlantic commercial vertical line fishery; calculated separately for open and closed seasons. Data filters described in the text. Kept rate for the period 19932011 was the single rate calculated using combined 2002-2011 data. Open season 2012-14 kept rate was calculated using combined open season 2012-14 data. Closed season 2012-14 kept rate was calculated using combined closed season 2012-14 data. Trips (discards) $=$ trips reporting to the discard logbook program and were summed as defined above (i.e., 2002-2011, 2012-14 open season, 2012-14 closed season). Trips (total effort) = number of trips reporting to the coastal logbook program. Vertical line effort $=$ hook hours fished. Calculated kept fish are reported as number of fish.

| Year | Season | Trips (discards) | $\begin{gathered} \text { Trips } \\ \text { (total effort) } \end{gathered}$ | Kept for Bait Rate | Kept for Bait Rate CV | Total Effort | Calculated Kept Fish |
